1. [Supported Stacks](#)
2. [Supported Web Browsers](#)
3. [Review the ProcessMaker versions to upgrade to ProcessMaker 3.5.x](#)
4. Run the [translation-repair](#) command.

Improvements

This section documents improvements for ProcessMaker 3.5.4:

1. **Support for Amazon Simple Query Service:** ProcessMaker supports Amazon Simple Query Service using Laravel as message queuing service.

Bug Fixes

This section documents bug fixes for ProcessMaker 3.5.4:

1. **The T0 header now displays all the email recipients instead of only the first one:** Email Log and Message history now displays the T0 column with a list of all email recipients. The number of how many email recipients to display is limited by the email server configuration.
2. **The Process Owner is now reassigned automatically after removing its owner:** After a ProcessMaker user that owns a process has been deleted, that process becomes public and that process belongs to the ProcessMaker administrator.
3. **Active Directory authentication now displays the reason for the error committed in the logon procedure:** When the password has expired, the message **User's account has expired** displays. When the user authenticates using Sync with LDAP and the password is disabled, the message **New password has been requested for the account** displays.

4. **ProcessMaker password policies now do not apply to Active Directory user validation:**
When using LDAP, ProcessMaker does not apply its own policies or the Enhanced Login Policies for Active Directory user validation because these authentication protocols already do the validations.
5. **The `getValue()` method now returns the correct value:** The `getValue()` method returns the key value for a radio control.
6. **Script tasks now assign the correct start and end times:** Times for start and end tasks are assigned correctly when working with Script tasks.
7. **Process import dates are now different whether by its creation date or if it is an update:** If the imported process is already created, the created date remains. If the imported process is not registered in the imported ProcessMaker environment, that environment registers the new imported date.
8. **`PMFUpdateUser()` now updates user data correctly:** `USERS` and `RBAC_USERS` ProcessMaker tables are updated properly when using the `PMFUpdateUser()` function.

Previous Release Notes
