1. [Supported Stacks](#)
2. [Supported Web Browsers](#)
3. [Review the ProcessMaker versions to upgrade to ProcessMaker 3.6.x](#)
4. The release installation requires to run the [translation-repair](#) command and run the [flush-cache](#) command.

Bug Fixes

This section documents bug fixes for ProcessMaker 3.6.2:

1. **Web entry validates correctly the permissions when saving Dynaform data with current user:** After filling in and saving a Dynaform in draft inbox, ProcessMaker validates the permissions with the following criteria:
 - If the user continues with the session, the web entry continues with the current logged on user session.
 - If the user logout from the active session, ProcessMaker ends the session automatically.
2. **Global Date Format option updates correctly PM case Information details:** Global Date Format configuration updates the dates on the following PM case Information sections: Delegation, Process Information, Task Information, Case History (on Task TransferDate, Start Date and End Date columns), Message History (displays the current Time Zone of the user), Updated Documents (on Create Date column), Generated Document.
3. **Values when creating a PM_Table using API save correctly:** fld_label and fld_autoincrement values save correctly the data for PM_Table when using the PM Rest API service.
4. **Inactive processes are not able to initiate cases when they are inactive:** Cases are not accessible anymore when trying to start ProcessMaker Processes with the Inactive status enabled when using web entries.

5. **Validation message now displays before the routing screen if the assignment user is empty:** The message **The task doesn't have any users** displays before the routing screen when the assignment user is empty and when doing a derivation to a parallel task. This validation does not apply for Value-Based Assignment, Self Service Value-Based and Multi-Instance Value-Based Assignment Rules cases.
6. **Supervisor Reassign Folder does not display Unassigned cases anymore:** Unassigned cases do not display in the Supervisor Reassign Folder, reassign does not allow reassigning unassigned cases because an unassigned case does not have an owner.
7. **Label and key on suggest controls in grids display the values correctly:** Label and key values keep the selected values when using suggest controls on PM Dynaforms grids and after changing between tasks in edit and view modes.
8. **Dynaforms display correctly on mobile devices:** When opening a web entry from a mobile device and on multiple-step cases, the Dynaform displays correctly.
9. **The Sum function is working properly on grids:** When working with dependent controls in grids, the Sum function works correctly.

Previous Release Notes
