1. [Supported Stacks](#)
2. [Supported Web Browsers](#)
3. [ProcessMaker 3.3.0 or later must be installed to upgrade to ProcessMaker 3.3.7](#)

## Bug Fixes

This section documents bug fixes for ProcessMaker 3.3.7:

1. **Case notes display the correct time when set through a trigger:** The conversion from UTC to the user's time zone was implemented so that the times in [cases notes](#) display accurately when the Multi Time Zone feature is enabled.
2. **The Email log now populates the "Error" column with the information collected from the Mail server:** The error raised by the [Mail server](#) is stored in the **Error** column of the [Emails log](#) if the email notifications fail to send. The **Error** column validates when using PMFSendMessage, Action by Email, Notifications, Case Note and Sent Mail with Cron functions.
3. **The performance in Advanced Search is improved:** The performance is improved when the cases are filtering by case number, case title, and task title.
4. **File error no longer displays while importing Data Reporting Tools reports:** The .pmp file extension now is available to upload to ProcessMaker.
  - **Scope:** This bug affects ProcessMaker version 3.3.1 and later.
5. **Case Title no longer disappears if there is a trigger after routing a task:** Case titles configured through [case labels](#) now display in the next task if there is a trigger after routing a task. The bug solution applies to case titles in the following lists: Inbox, Participated, Unassigned, Paused and Advanced Search.
  - **Scope:** This bug affects ProcessMaker version 3.3.3 and later.

6. **The printing form now displays all the files uploaded in a Multiple File control:** All the files uploaded to the Multiple File control are now correctly aligned to display in the [printing form](#) even if the case is not completed and the files are not confirmed yet. The bug solution also applies to the Multiple File in a Grid control and in the preview of the Dynaform.
  - **Scope:** This bug affects ProcessMaker version 3.3.0 and later.
7. **The PMCaseLink function in a script task after a timer event now uses the default skin as part of the generated link:** The default skin in the `env.ini` file configured in the [System](#) configuration is now used if a skin is not specified in the [PMCaseLink](#) function in a script task after a timer event.
8. **The Textarea scrollbar now displays when you review the Dynaform in the Preview menu:** In the [Preview](#) menu, the Textarea scrollbar now displays.
9. **Output Documents downloads with the correct file name:** The text placed before the character “/” no longer loses. Note that special characters like \ /: \*? <> |>, which are not supported by the operating system, are replaced by underscores ( \_ ) in the names of downloaded Output Documents. Characters with accent no longer are replaced by equivalent english characters. Double quotes are removed from the filename.

## Known Issues

This section documents known issues for ProcessMaker 3.3.7:

1. **Email logs are not populating when the email is sent by a PM function that is located in a script task:** Using the [PMFSendMessage](#) or [PMFSendMessageToGroup](#) functions inside a script task, the logs are not populating in the [Emails log](#).
2. **The printing form does not work in the Case Tracker:** An error displays after clicking the [print](#) button in the [Case Tracker](#).
3. **The PMCaseLink function in a script task after a timer event don't use the default language as part of the generated link:** The default language in the `env.ini` file configured in the [System](#) configuration is not used if a language is not specified in the [PMCaseLink](#) function in a script task after a timer event.
4. **Cron execution doesn't limit the number of activities when it's specified:** The [cron.php](#) script executes all the activities and not just the defined ones.
5. **Output Documents file removes the first character from the filename if it starts with an accent or ñ:** The [file name generated](#) does not have the accented vowel or ñ if the file name starts with these characters.

## Previous Release Notes
