1. Supported Stacks
2. Supported Web Browsers
3. ProcessMaker 3.3.0 or later must be installed to upgrade to ProcessMaker 3.3.8

Bug Fixes

This section documents bug fixes for ProcessMaker 3.3.8:

1. **Email logs now populate the Task and Process columns when the email is sent by a PM function that is located in a script task:** Using the `PMFSendMessage` or `PMFSendMessageToGroup` functions inside a script task, trigger and process event, the logs now populate the Task and Process columns in the Emails log. Note that the **Task** column populates only if the `delIndex` argument is provided. Also, the information of the **Type** column was improved to identify what actions trigger the emails besides the PM functions. For example, email events will have the type as **EVENT**. Note that the **TRIGGER** type is no longer used and the **DERIVATION** type renames to **ROUTING**.

2. **Script tasks now wait until Action By Emails complete to fetch files:** The files uploaded in an Action by Email (link to fill a form) now are saved before the script task runs.

3. **Hints inside Subforms with more than 150 characters no longer change the position of the window:** Hints no longer change the position of the window inside Subforms, outside Subforms, or hints inside a row Col-Span. The hint icon now aligns at the top of the control. Additionally, the hint icons no longer show up when the Dynaform prints.

4. **KPIs now display the Inbox status graphs:** When selecting the **Inbox Status** as the indicator, KPIs now display the Inbox status graphs.

5. **LDAP groups now synchronize in Stack N225:** The users are correctly synchronized to their respective LDAP groups. If the group is synchronized again, the group is no longer duplicated.

6. **Fields are aligned correctly in Dynaforms:** The fields align correctly compared to the other rows when distributed in different col-span, even when using the hint property. A new div container was added to each field in the HTML template to ensure the hint remains next to the field.

7. **The Case Title no longer disappears in the Advanced Search list when all tasks have the same label:** After routing a case from a second to a third task in which the second task has triggers, the case label no longer disappears in the **Advanced Search** list.
   ○ **Scope:** This bug affects ProcessMaker version 3.3.0 and later.

8. **Dependent fields inside grids no longer lose their values if the dependent field places before the independent field:** If the position of the independent field sits to the right of the dependent field in a grid, the grid fields no longer lose their values.
   ○ **Scope:** This bug affects ProcessMaker version 3.2.3 and later.

9. **When running a case, the Information menu displays correctly when the case is in the Reassign list:** As a process supervisor, the **Information** menu displays correctly when the case is in the **Reassign** list.

10. **Cron execution now correctly limits the number of activities when it's specified:** The `cron.php` script runs only the defined activities. If there are no defined activities in this case, the `cron.php` script runs all of them.
    ○ **Scope:** This bug affects ProcessMaker version 3.3.6 and later.

Known Issues

This section documents known issues for ProcessMaker 3.3.8:

1. **The File control and Date control do not fit the size of the other controls when displayed on a tablet or distributed in rows:** The **File** control and **Date** control do not have the same size as other controls.

2. **The email triggered by the reassignment action is being registered with the `CASE_NOTE` type:** The Email log populates the **Type** column with the value `CASE_NOTE` for emails that are triggered due the reassign, cancel or pause actions.

3. **Case title does not update correctly with the values provided in a trigger placed after routing:** The case title does not update after routing. Therefore, the changes made to the variables do not reflect in the title until the case is opened.
   ○ **Workaround:** Move the triggers that affect the title to another section, such as before routing.

4. **The File control does not show the validation of the `files_white_list` when working with Actions by Email:** The File control does not show the validation of the `files_white_list` when

Actions by Email through [Link to fill a form](#) uploads a file. If the Dynaform does not upload a file, the Dynaform refreshes and the data introduced might get lost.
   - ○   **Workaround:** Use [Multiple File](#) control instead of a File control.

Previous Release Notes

Refer to the previous release notes from ProcessMaker versions 3.2 through 3.3.7:
